

Are vanadium flow batteries the future of energy storage?

Vanadium flow batteries are expected to accelerate rapidly in the coming years, especially as renewable energy generation reaches 60-70% of the power system's market share. Long-term energy storage systems will become the most cost-effective flexible solution. Renewable Energy Growth and Storage Needs

Will vanadium flow batteries surpass lithium-ion batteries?

8 August 2024 - Prof. Zhang Huamin, Chief Researcher at the Dalian Institute of Chemical Physics, Chinese Academy of Sciences, announced a significant forecast in the energy storage sector. He predicts that in the next 5 to 10 years, the installed capacity of vanadium flow batteries could exceed that of lithium-ion batteries.

Why are vanadium redox flow battery systems important?

Battery storage systems become increasingly more important to fulfil large demands in peaks of energy consumption due to the increasing supply of intermittent renewable energy. The vanadium redox flow battery systems are attracting attention because of scalability and robustness of these systems make them highly promising.

What is the difference between a lithium ion and a vanadium flow battery?

Unlike lithium-ion batteries, Vanadium flow batteries store energy in a non-flammable electrolyte solution, which does not degrade with cycling, offering superior economic and safety benefits. Prof. Zhang highlighted that the practical large-scale energy storage technologies include physical and electrochemical storage.

Why does a vanadium electrolyte deteriorate a battery membrane?

Exposure of the polymeric membrane to the highly oxidative and acidic environment of the vanadium electrolyte can result in membrane deterioration. Furthermore, poor membrane selectivity towards vanadium permeability can lead to faster discharge times of the battery. These areas seek room for improvement to increase battery lifetime.

What are vanadium redox flow batteries (VRFBs)?

In numerous energy storage technology, vanadium redox flow batteries (VRFBs) are widely concerned by all around the world with their advantages of long service life, capacity and power independent design [9, 10].

Innovative membranes are needed for vanadium redox flow batteries, in order to achieve the required criteria; i) cost reduction, ii) long cycle life, iii) high discharge rates and iv) high current densities. To achieve this, variety of materials were tested and reported in literature.
