Capacitor-based high-pass filters work in a similar way to low-pass filters, but they use a different combination of components to determine the cutoff frequency. In this type of filter, the capacitor is connected in series with the input signal, and the resistor is connected in parallel. Here's a simple example of a capacitor-based high-pass ...

Capacitors for voltage support have less influence on the precise re-production of the music, providing they have sufficiently large capacitance. However, they should not be disregarded in genuine high-end equipment. With qualified optimisation in this field too, ultimate refinements in ...
