

Which capacitors should be used in a 400 volt distribution network?

We recommend using capacitors with higher nominal voltage than the nominal voltage of the distribution network. In a 400 V distribution network, we recommend capacitors with a nominal voltage of 440 V and capacitors with a nominal voltage of 480 V for detuned power factor correction with reactors.

What are KNK capacitors used for?

The KNK capacitors are used for power factor correction of inductive consumers (transformers, electric motors, rectifiers) in industrial networks for voltages up to 690 V. Low voltage power factor correction capacitors can achieve savings by lowering power factor, reduced system losses.

What causes a low voltage capacitor?

This effect may be caused by the usage of non-linear devices (generation of higher harmonics), low short-circuit power of voltage sources (voltage fluctuation), etc. We recommend using capacitors with higher nominal voltage than the nominal voltage of the distribution network.
