What are charging piles for new energy vehicles?

As one of the new infrastructures, charging piles for new energy vehicles are different from the traditional charging piles. The "new" here means new digital technology which is an organic integration between charging piles and communication, cloud computing, intelligent power grid and IoV technology.

Why are charging piles important?

Charging piles are of great significance to developing new energy vehicles, and they are also an important part of the emerging digital economy such as intelligent traffic and intelligent energy. The State Grid Corporation of China (SGCC) is taking an active role in the development of new energy vehicles.

What is a charging pile?

Its function is similar to that of a fuel dispenser in a gas station. It can charge various types of electric vehicles according to different voltage levels. It is an alternative of traditional gas station and gas pump. Charging piles can be installed on the ground or walls of public buildings and residential area parking lots or charging stations.

How long does it take to build a charging pile?

To build a charging pile, the initial investment cost is low, the investment time is relatively small, and the occupied area is also small. Long charging time. Charging piles have always been regarded as the most standard energy supplement method for new energy vehicles. In slow charging mode, the charging process takes 6-8 hours.

How does a charging pile display work?

The display screen in the charging pile can display important data such as charging amount, charging time, and cost. Consumers can use a specific charging card to swipe the card at the charging pile. What are the types of charging pile? 1. Different installation locations: public charging piles and charging piles built with the vehicle. 2.

What is a charging pile gateway?

The gateways meet the demand of all charging pile communication scenarios and collect real-time electricity consumption information of charging piles so as to realize information interaction on charging and discharging between the power grid and charging piles, as well as meet the demand on charging service expansion.
