

Is the battery industry a real challenge in France?

The structuring of an innovative and competitive industry covering the entire battery value chain is a real challenge, and one to which the French government and a number of companies are fully committed. BROWSE THIS DIRECTORY AND FIND YOUR MATCH !

What contributes to the cost of battery cells?

The largest single contributor to the cost of battery cells is the materials used in them, especially the cathode materials. In addition to lithium, the transition metals manganese, iron, cobalt and nickel are used in particular.

Why do batteries cost so much?

And so more and more of the technological innovations introduced into the battery are aimed at reducing costs, even if at the same time features such as vehicle range tend to deteriorate. The largest single contributor to the cost of battery cells is the materials used in them, especially the cathode materials.

What factors influence the price of battery materials?

The materials under investigation are predominantly used in the battery value chain, so that the dynamics are essentially shaped by battery demand and the expansion of production capacities for materials. Their price therefore particularly reflects market factors such as supply and demand fluctuations.

What role does supply contract design play in battery pricing?

In its Battery Update, Fraunhofer ISI points out which role the design of supply contracts plays in pricing and how the changes in raw material prices affect the costs of different lithium-ion battery technologies. Falling costs for battery cells have long been perceived as an essential condition for the widespread success of electromobility.

Why did battery prices fall in 2019?

The global economic slowdown due to the Covid19 pandemic, for example, may have led to the expectation of decreasing demand for battery raw materials. As a result, prices fell in 2019 and the beginning of 2020.
