

What is a fixed battery of tests in?

A fixed battery refers to a set of tests with a common metric and comparison of performance. It allows for a known sensitivity, hit rates, and the calculation of positive predictive power or negative predictive power. The passage discusses the advantages of using a fixed battery of tests in the given context.

Why is a fixed battery necessary?

A fixed battery allows for a known sensitivity, hit rates, and the calculation of positive predictive power or negative predictive power. For instance, the Global Neuropsychological Deficits Scale (GNDS) (Reitan and Wolfson 1993) from the HRNB is an example of this application.

Why is a fixed battery better than a co-norming battery?

A fixed battery usually has better reliability and consistency across different neuropsychologists. An additional strength of a fixed battery is the benefit of co-norming. A fixed battery of tests were all normed on the same group or population. However, the passage does not directly compare a fixed battery to a co-norming battery, it just mentions the advantages of a fixed battery including its reliability and the benefit of co-norming.

Are fixed battery approaches valid?

Although Bigler did not make the following point, arguments that fixed battery approaches are the only truly validated procedures strongly imply that the majority of clinical neuropsychologists are practicing in an invalid manner.

What are the weaknesses of a fixed battery approach?

The fixed battery approach has several disadvantages. First, it assumes that one combination of tests is able to assess all or the majority of patients (one size fits all). Second, it does not adapt to new tests or testing approaches as neuropsychological science progresses.
